

Incident report analysis

Summary	The company experienced a security event when all network services		
	suddenly stopped responding. The cybersecurity team found the disruption		
	was caused by a distributed denial of services (DDoS) attack through a flood		
	of incoming ICMP packets. The team responded by blocking the attack and		
	stopping all non-critical network services, so that critical network services		
	could be restored.		
Identify	A malicious actor or actors targeted the company with an ICMP flood attack.		
	The entire internal network was affected. All critical network resources needed		
	to be secured and restored to a functioning state.		
Protect	The cybersecurity team implemented a new firewall rule to limit the rate of		
	incoming ICMP packets and an IDS/IPS system to filter out some ICMP traffic		
	based on suspicious characteristics.		
Detect	The cybersecurity team configured source IP address verification on the		
	firewall to check for spoofed IP addresses on incoming ICMP packets and		
	implemented network monitoring software to detect abnormal traffic		
	patterns.		
Respond	For future security events, the cybersecurity team will isolate affected		
	systems to prevent further disruption to the network. They will attempt to		
	restore any critical systems and services that were disrupted by the event.		
	Then, the team will analyze network logs to check for suspicious and abnormal		
	activity. The team will also report all incidents to upper management and		
	appropriate legal authorities, if applicable.

To recover from a DDoS attack by ICMP flooding, access to network services need to be restored to a normal functioning state. In the future, external ICMP flood attacks can be blocked at the firewall. Then, all non-critical network services should be stopped to reduce internal network traffic. Next, critical network services should be restored first. Finally, once the flood of ICMP packets have timed out, all non-critical network systems and services can be brought back online.
